

Supplemental Data

Figure S1. RNA-seq based oncogenic pathway analysis. A) oncogenic Kras signaling pathway was significantly activated in the lung tumors of adenoma and ADC mouse model compared to the normal control mice as detected by BD-Func program. * denotes Dunnett's P values less than 0.05. For this comparison, we used a cohort comprising lung ADC mice and normal control mice and collected primary lung tumor samples characterized as either adenoma or ADC, as well as normal lung tissues from control mice (each group had 8 samples). B) comparing the airway gene expression patterns between lung ADC mice and normal mice also showed upregulated oncogenic Kras pathway activity according to GSEA analysis.

A Oncogenic Kras pathway activity in lung adenoma and ADC tumors versus normal lung

B Airway gene expression in lung ADC mice versus normal mice

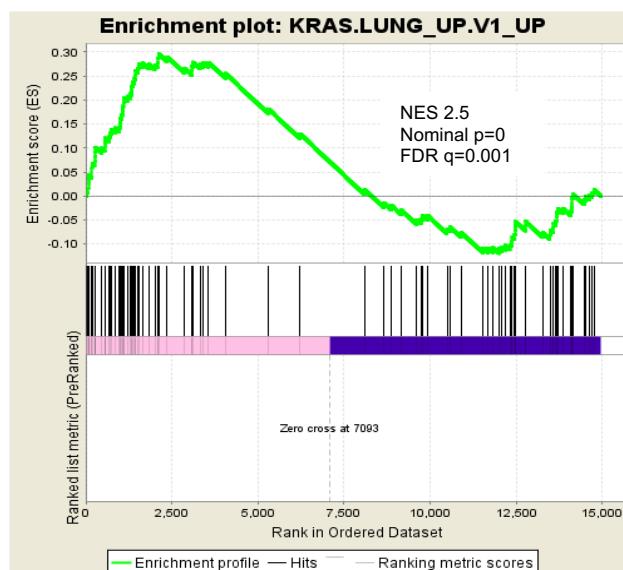

Figure S2. The down-regulation of key glycolytic enzymes by pioglitazone treatment in the bronchial airway of mice harboring ADC lesions. The schematic plot of the functions of the down-regulated glycolytic enzymes in glucose metabolism.

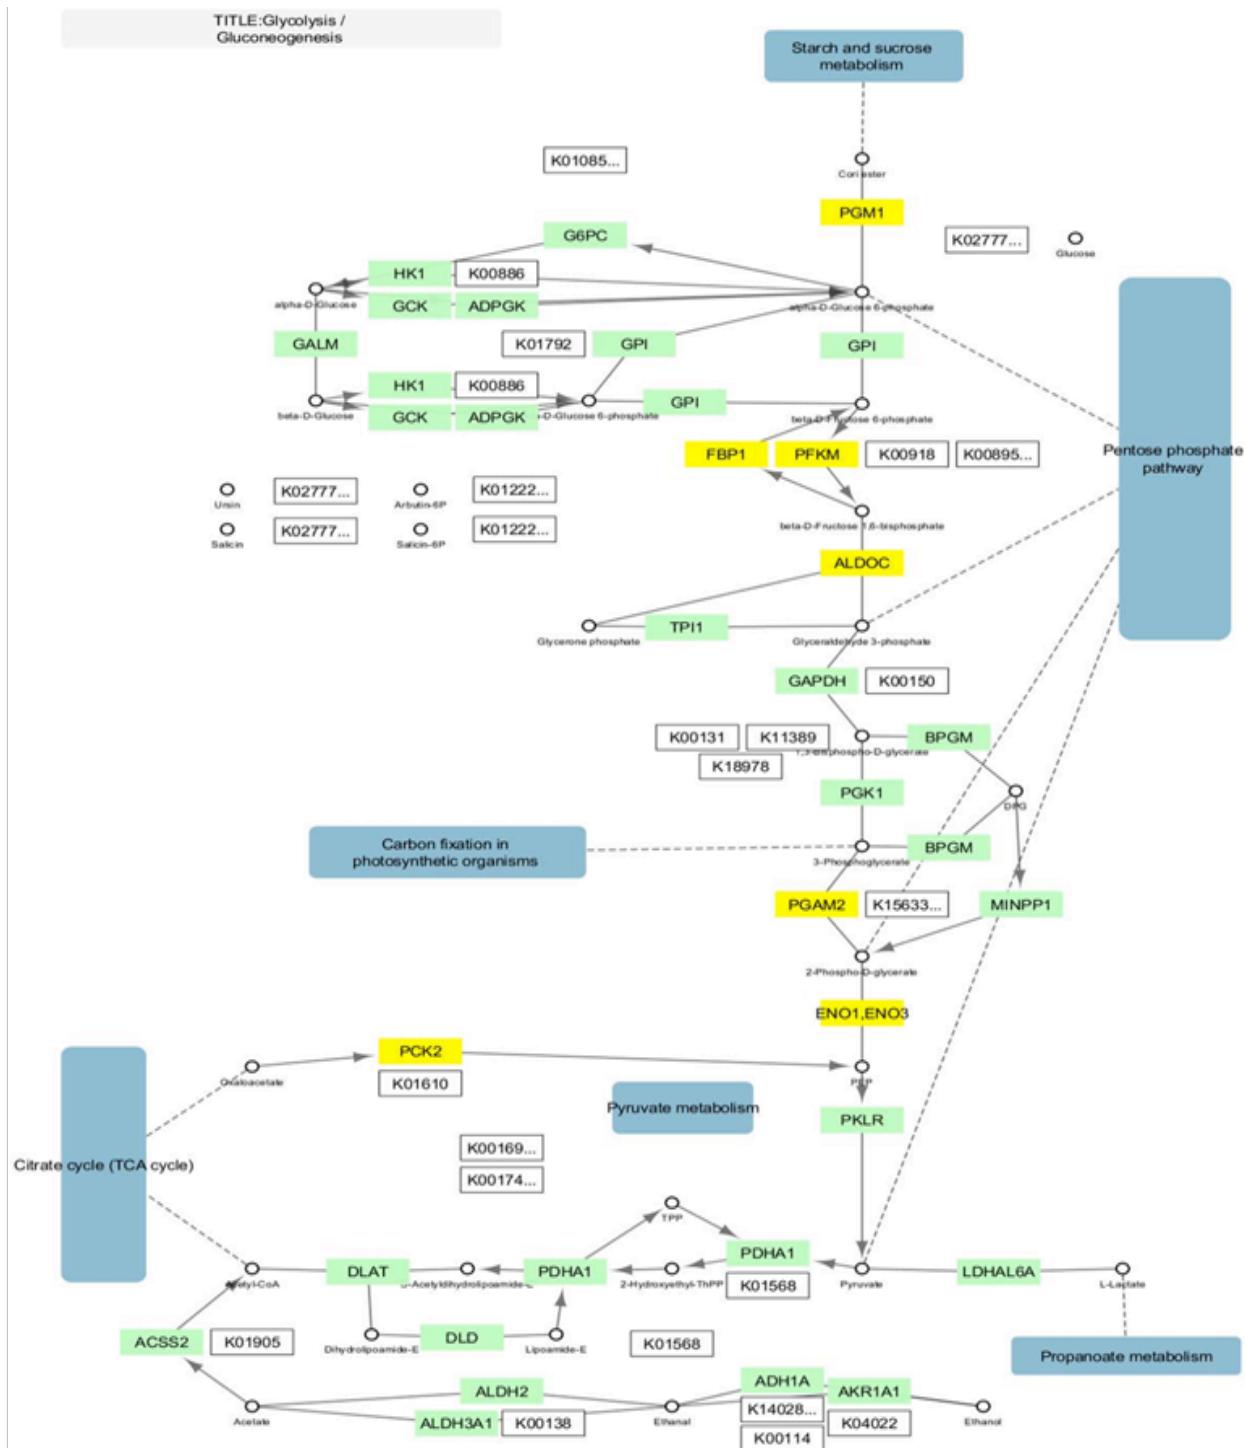

Figure S3. The down-regulation of the oncogenic Kras signaling activity in the lung adenocarcinoma tumors of mice treated by pioglitazone, which reversed the activity of oncogenic Kras signaling to normal level. Groups: ADC - lung adenocarcinoma tumors of mice without pioglitazone treatment; normal: normal lung tissues from corresponding A/J mice; piogli: lung adenocarcinoma tumors of mice subjected to pioglitazone treatment. * denotes Dunnett's P values less than 0.05.

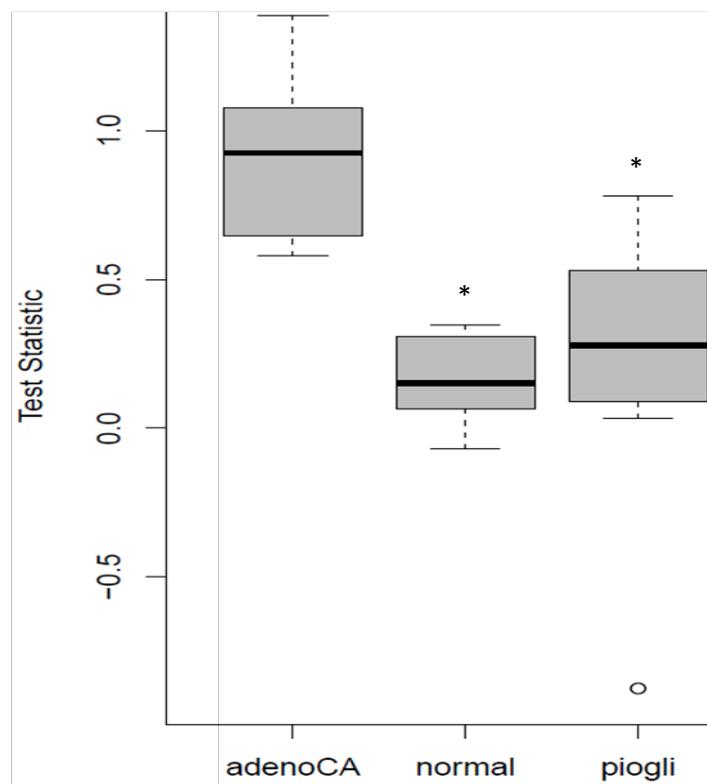

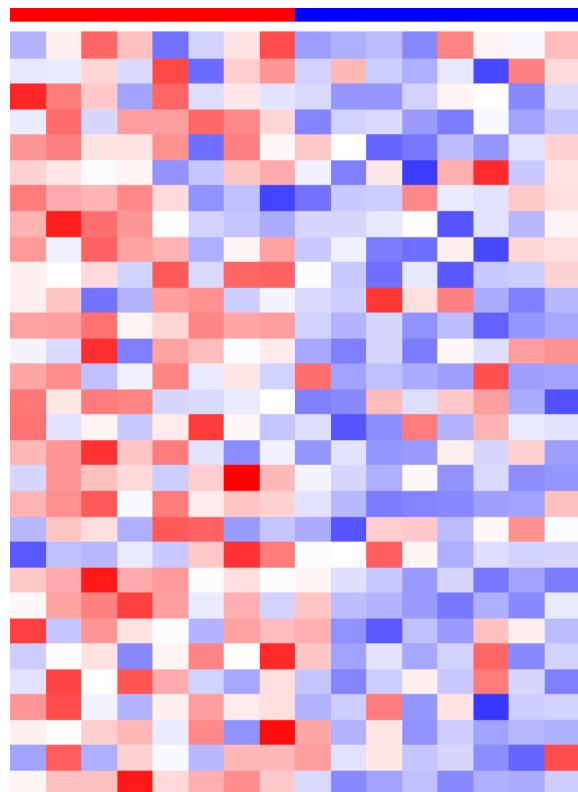

Figure S4. Heatmap showing the thirty glucose metabolism genes (A) down-regulated in the airways of tumor-bearing mice after pioglitazone treatment were (B) similarly down-regulated in the lung ADCs of mice treated with pioglitazone compared to the tumors of non-treated mice.

A. Bronchial airway

Before pioglitazone After pioglitazone

B. Lung ADC tumor

Without pioglitazone

With pioglitazone

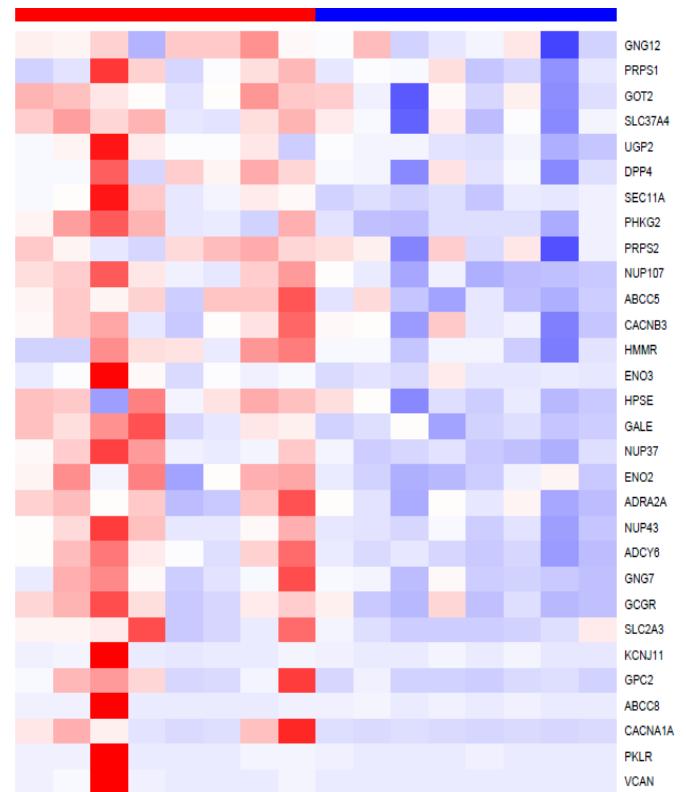

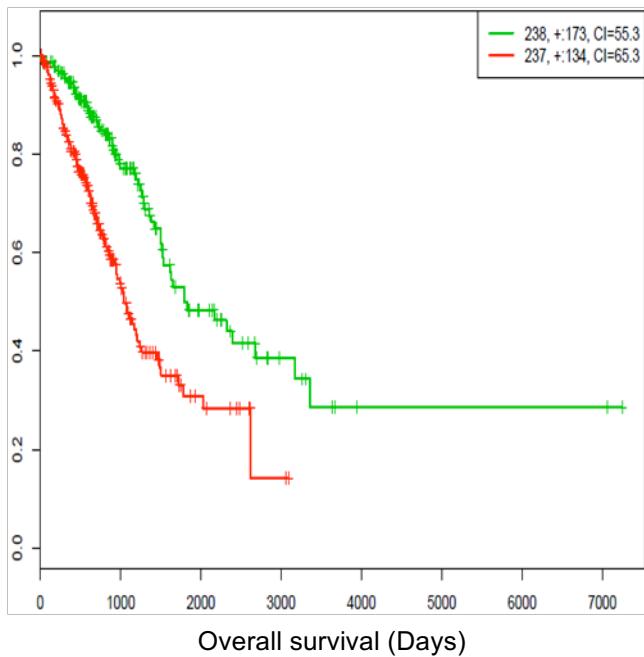

Figure S5. Kaplan-Meier analysis showing that the expression signatures of the pioglitazone treatment regulated glucose metabolism geneset ("Piog_Glu_LungADC") was significantly associated with the overall survival outcome across the four human lung ADC datasets. Red curve denoted high risk group based on the high expression of the "Piog_Glu_LungADC" geneset, green curve denoted low risk group based on the low expression of this geneset.

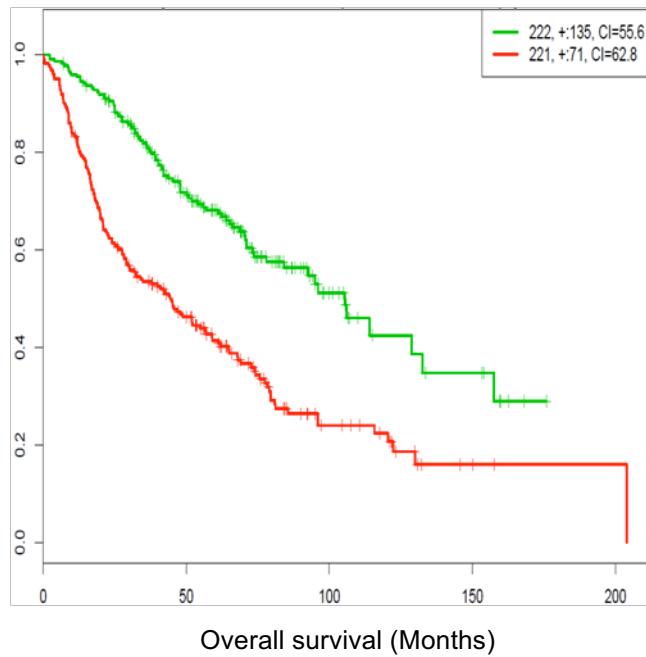

A. TCGA LUAD (N = 475)

Risk group HR = 2.27 (95% conf.
int. 1.65~3.11); P = 4.0E-07

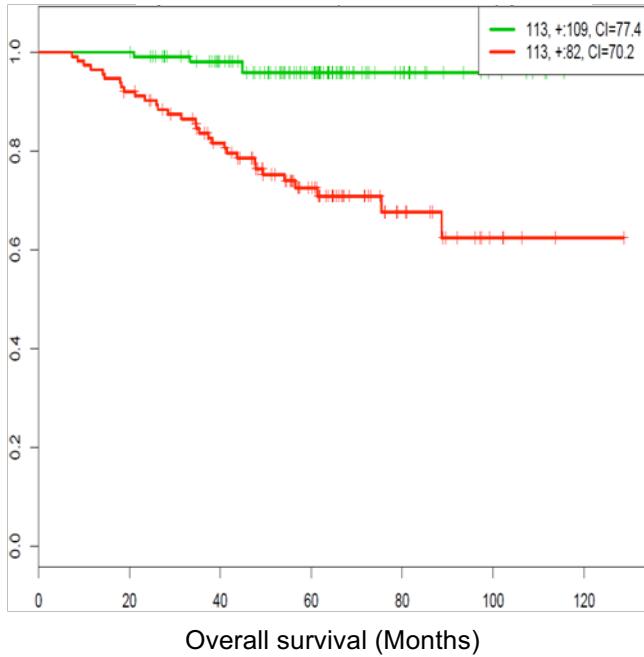

B. Director's Challenge Consortium NCI Lung (N = 443)

Risk group HR = 2.28 (95% conf. int.
1.75~2.98); P = 1.0E-09

C. Okayama Kohno Lung (N = 226)

Risk group HR = 8.54 (95% conf.
int. 3.01~24.2); P = 5.5E-05

D. Chitale Lung (N = 185)

Risk group HR = 8.19 (95% conf.
int. 3.63~18.45); P = 4.0E-07

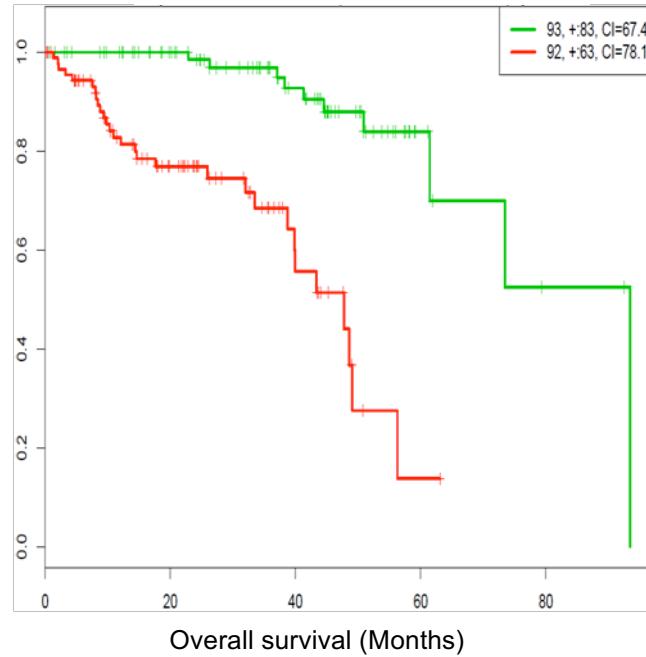

Figure S6. The glucose metabolism gene expression changes between the lung tumors collected from the VC (vinyl carbamate) - induced lung ADC mice model and the normal lung tissues collected from the control healthy mice. Among the 77 significantly changed glucose metabolism genes (FDR < 0.05), 70 genes were up-regulated and 7 were down-regulated.

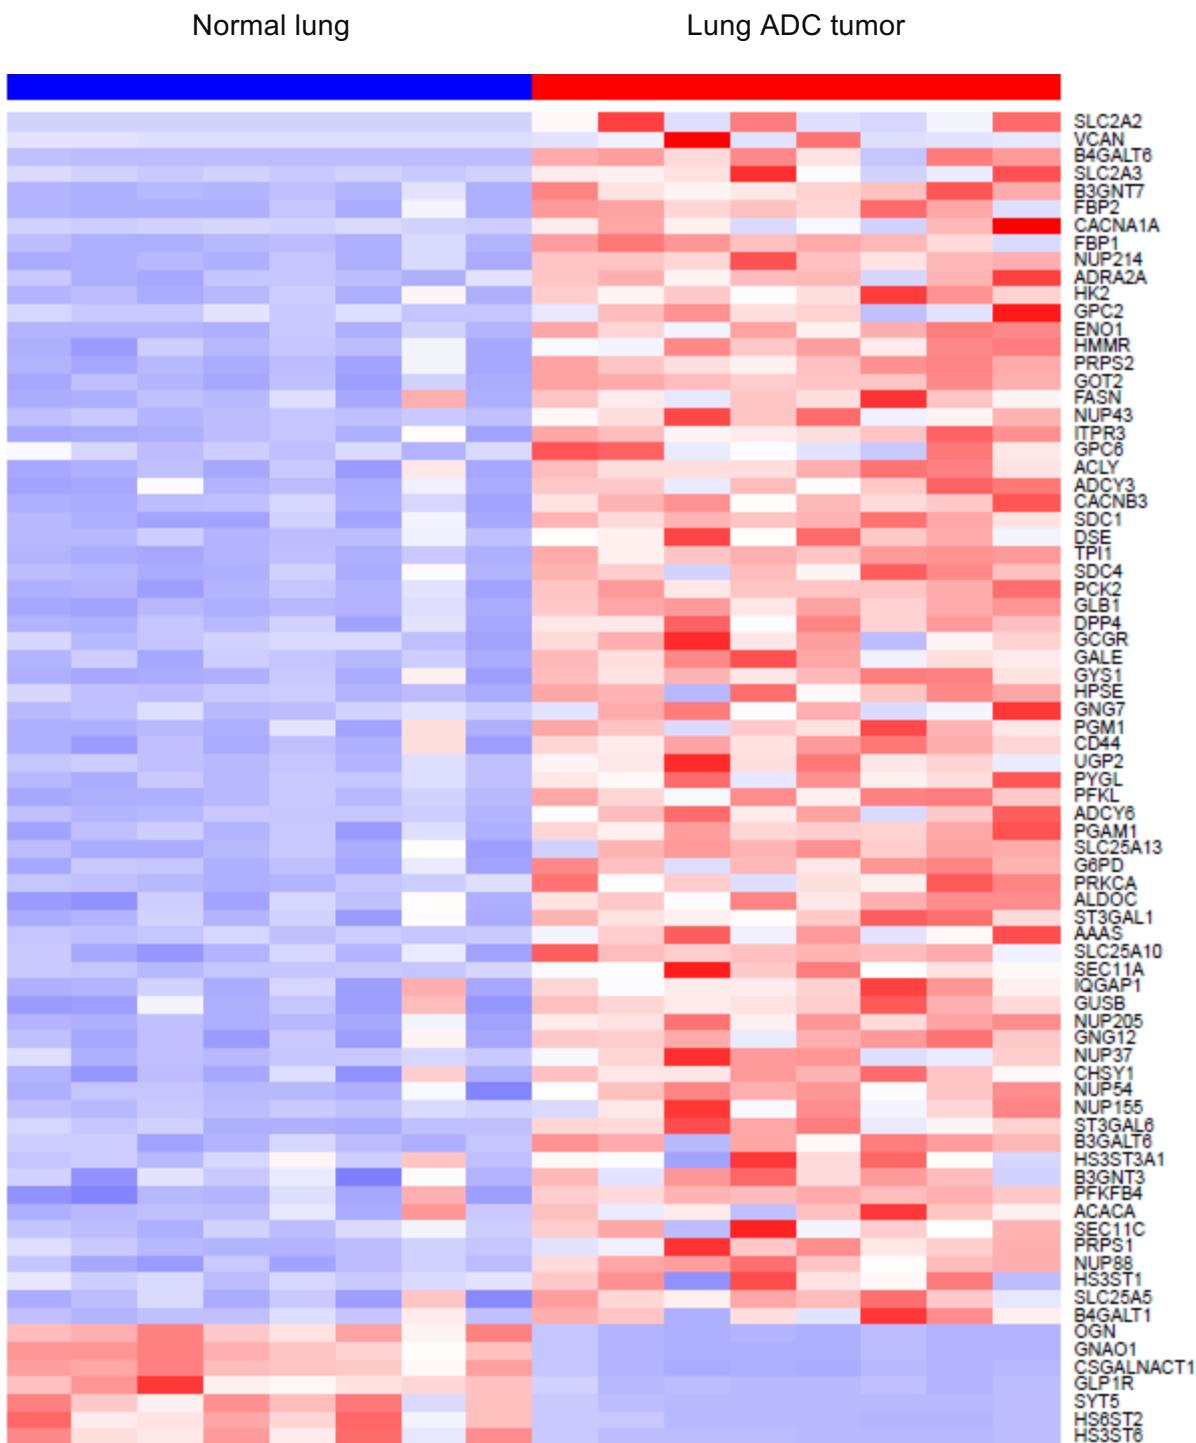

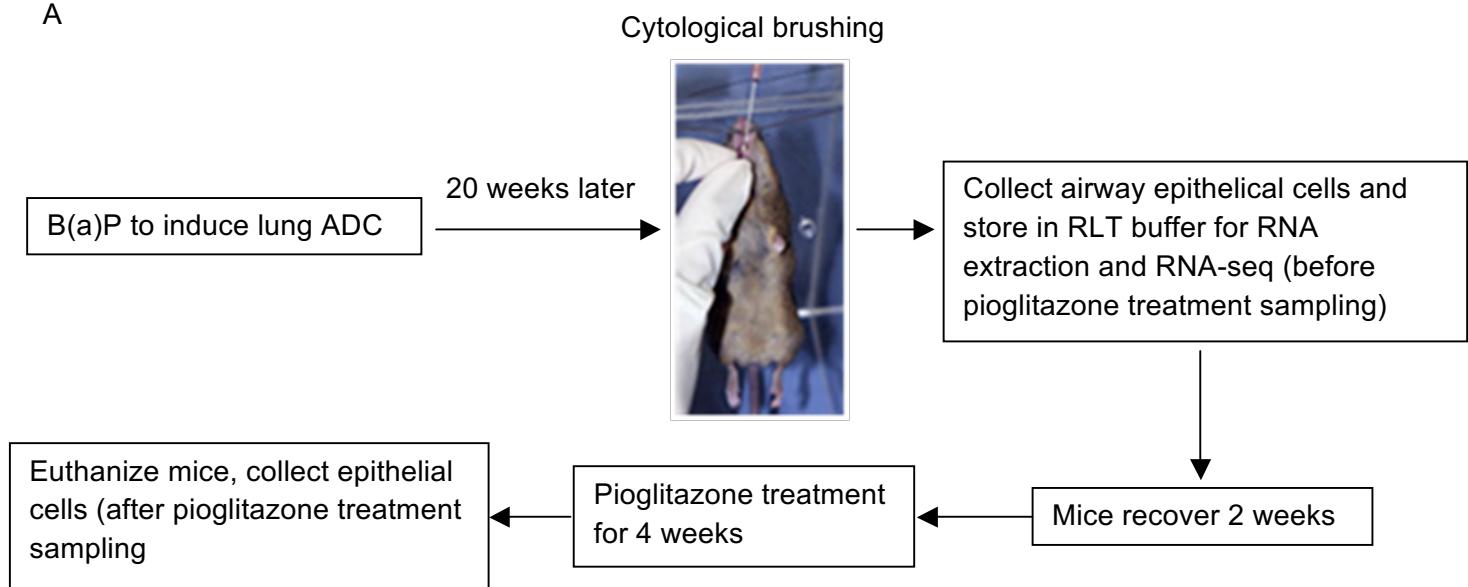

Figure S7. The procedures for airway brushing techniques. A) the “trachea-bronchial brushing” technique was illustrated. A cytological brush was used to collect epithelial cells from the trachea-bronchus region of anesthetized mice as “before pioglitazone treatment samples”, and stored in RLT buffer for RNA extraction and RNA-seq. The mice were given 2 weeks for recovery from brushing, and then treated with chemopreventive agent - pioglitazone. After 4 weeks of the treatment, epithelial cells were collected from the same mouse as “after treatment samples.” B) The “trachea-bronchial brushing” technique was successful at harvesting lung epithelial cells. Based on the H&E staining, over 95% of brushed cells were confirmed to be bronchial epithelial cells. Also, most of the harvested cells were shown to have intact epithelial cell membrane and morphology.

A

B

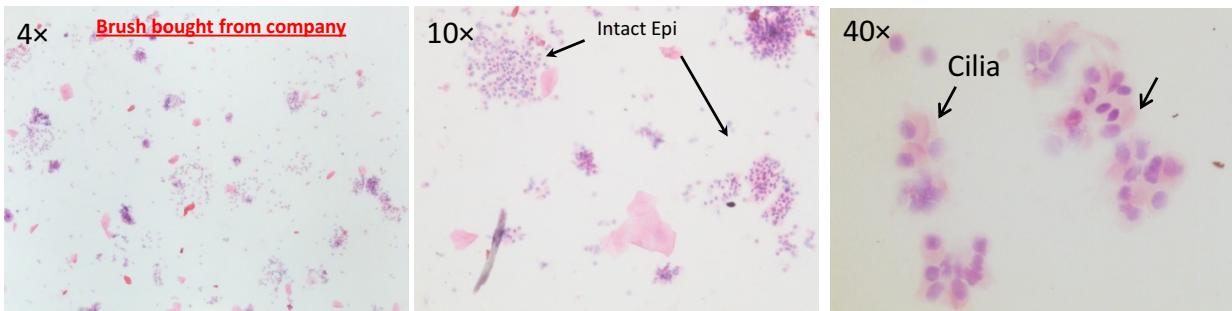

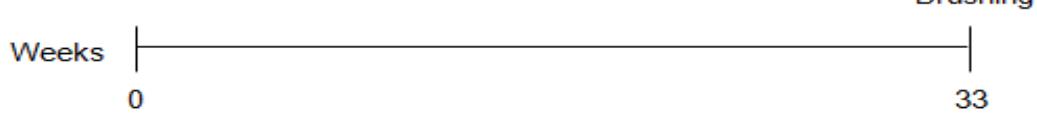

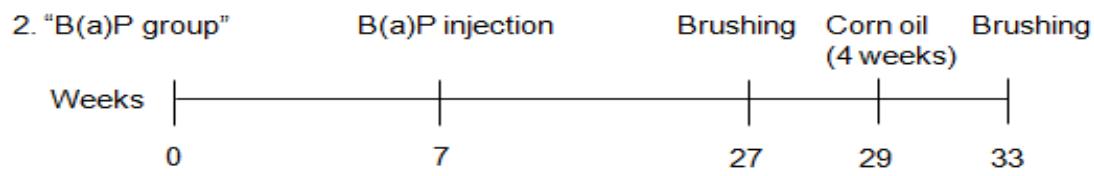

Figure S8. Timing of the experiments and sample collections in different groups of mice. A) timing of the bronchial airway epithelium samples collection by brushing and different treatment in the three groups of mice; B) timing of the lung tissue samples (normal lung or lung ADC tumors) collection and different treatment in the three groups of mice.

A. Airway epithelium samples

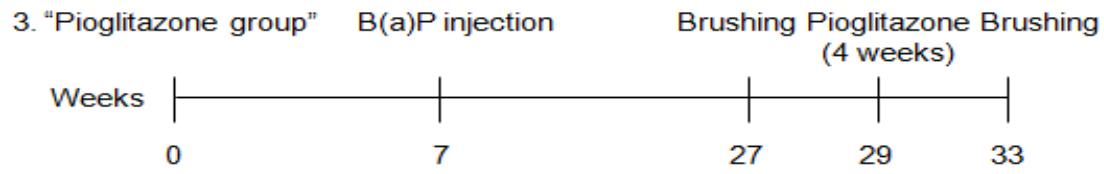

1. "Normal group"

2. "B(a)P group"

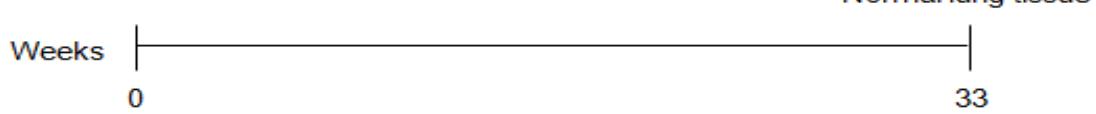

3. "Pioglitazone group"

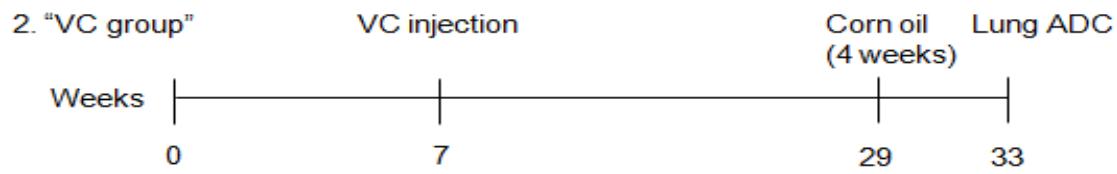

B. Lung tissue samples

1. "Normal group"

2. "VC group"

3. "Pioglitazone group"

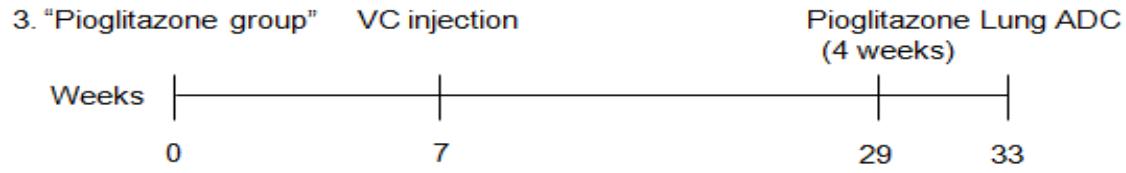

Table S1. Pioglitazone treatment led to 2,020 significantly up-regulated genes (FDR < 0.05) in the bronchial airway epithelial cells of B(a)P induced mouse lung ADC model.
