

Supplementary Figure 1: (A) Hind limb allograft survival showed a MST of 18.5 days in TBI alone (n=4), MST 24.5 days in TBI + CTLA4-Ig (n=4) , MST 80.5 days in MR1 alone (n=4) and MST 95.5 days in TBI + MR1 (n=3). Groups containing MR1 (MR1 alone and TBI+MR1) showed a significantly better VCA survival compared to TBI alone or TBI + CTLA4-Ig. (B) Donor-specific mixed chimerism was detected in animals treated with MR1 alone or TBI + MR1 alone in case animal survival was beyond 30 days after transplant. Percentage of K^d positive cells represented the proportion of cells expressing H-2K^d among PBMC in the blood. Statistical differences were calculated by log-rank test.

Supplementary Figure 2: (A) Representative gating strategy for detection of donor haplotype MHC class I expression in CD3⁺ T cells. A similar gating strategy was used for B220⁺ B cells and CD11b⁺ Macrophages. (B) At the time of sacrifice (POD70), mixed chimerism levels of central lymphoid organs (spleen) correlated with chimerism levels detected in peripheral blood. (Data are representative of 4 mice per group from 2-3 independent experiments, * P<0.05, ** P<0.01, NS = no significance, P values were calculated by 2-tailed *t* test)

Supplementary Figure 3: The production of IL-2, IL-10 or IL-17 in recipient CD4⁺ T lymphocytes was measured to determine CD4⁺ T cell reactivity. (A) IL-2 (B) IL-10 (C) IL-17 were measured at various time points in central lymphoid organs (LN). (Data are representative of at least 3 mice per group from 2-3 independent experiments, * P<0.05, ** P<0.01, NS = no significance, P values were calculated by 2-tailed *t* test)

Supplementary Figure 4: (A) Representative Treg-mediated suppression measured by CFSE dilution using flow cytometry. Conventional T cells (CD4⁺CD25⁻) were isolated from wild type C57BL/6 mice and labeled with CFSE. Cells were activated with anti-CD3 plus syngeneic bone marrow derived dendritic cells and cultured either alone or in the presence of various Tregs at different Treg-to-Responder ratios. After 72hr, proliferation was determined by CFSE dilution among viable CD4⁺ T cells using flow cytometric analysis. (B) Tregs isolated from recipients treated with TBI + CoB showed stronger suppression compared to those of recipients treated with CoB alone. The latter showed a similar suppressive activity than natural Tregs isolated from wild type C57BL/6 animals.

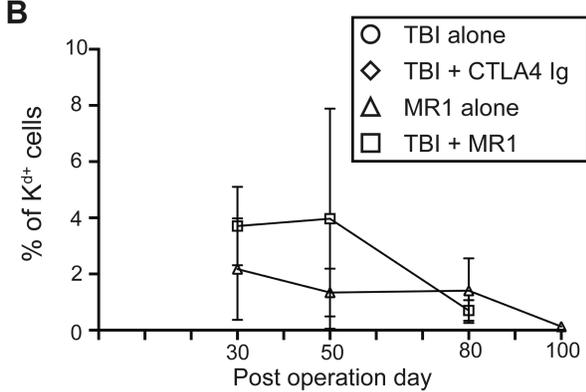

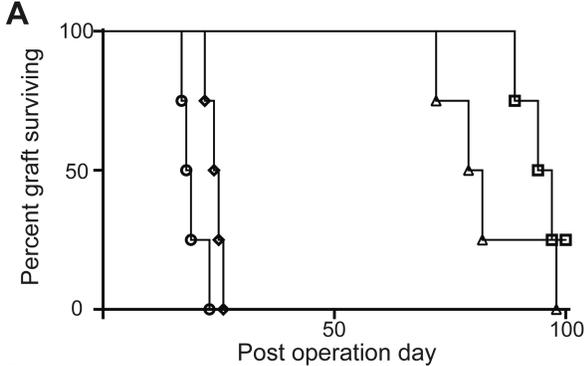

Supplementary Figure 5: (A) Representative gating strategy for detection of donor-derived Foxp3⁺ T cells isolated from spleen. (B) While the overall percentage of Foxp3⁺ CD4⁺ T cells was comparable between both groups (left), the percentage of H-2K^d expression on Foxp3⁺ T cells was significantly ($p > 0.05$) higher in recipients treated with TBI + CoB compared to CoB at POD70. (Data are representative of 4 mice per group from 2-3 independent experiments, * $P < 0.05$, ** $P < 0.01$, NS = no significance, P values were calculated by 2-tailed *t* test)

Supplementary Figure 6: (A) Schematic illustration of modified treatment strategies. These included the combination of total body irradiation, CTLA4-Ig, and anti-CD154 mAb (MR1) in the presence of PC 61 either 7 or 30 days after transplant. Graft survival and mixed chimerism analysis were performed as outlined. (B) Depletion of Treg cells using PC61 did neither on POD 7 nor 30 have a deleterious effect on graft survival. In both groups, animals experienced survival up to 100

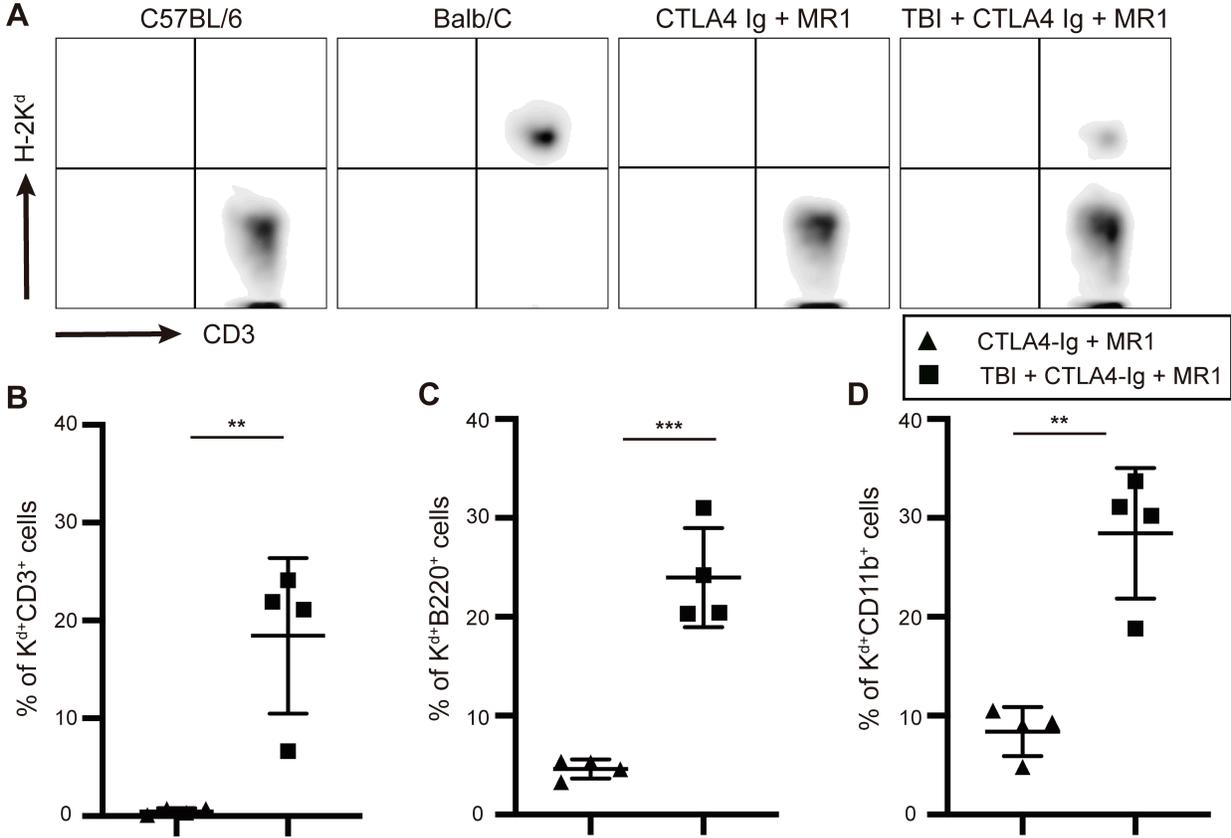

days (C-E) Furthermore, depletion of Treg cells using PC61 did not affect the establishment of multi-lineage stable mixed chimerisms. Statistical differences were calculated by log-rank test.

Supplementary Figure 7: (A) Representative gating strategy for detection of donor versus recipient derived APC in the recipient thymus. (B) The percentage of H-2K^d expression on CD11c⁺ dendritic cells in the thymus was significantly ($p < 0.01$) higher in recipients treated with TBI + CoB compared to CoB at POD70. (Data are representative of 4 mice per group from 2-3 independent experiments, * $P < 0.05$, ** $P < 0.01$, NS = no significance, P values were calculated by 2-tailed *t* test)
