

Figure S1

NIA

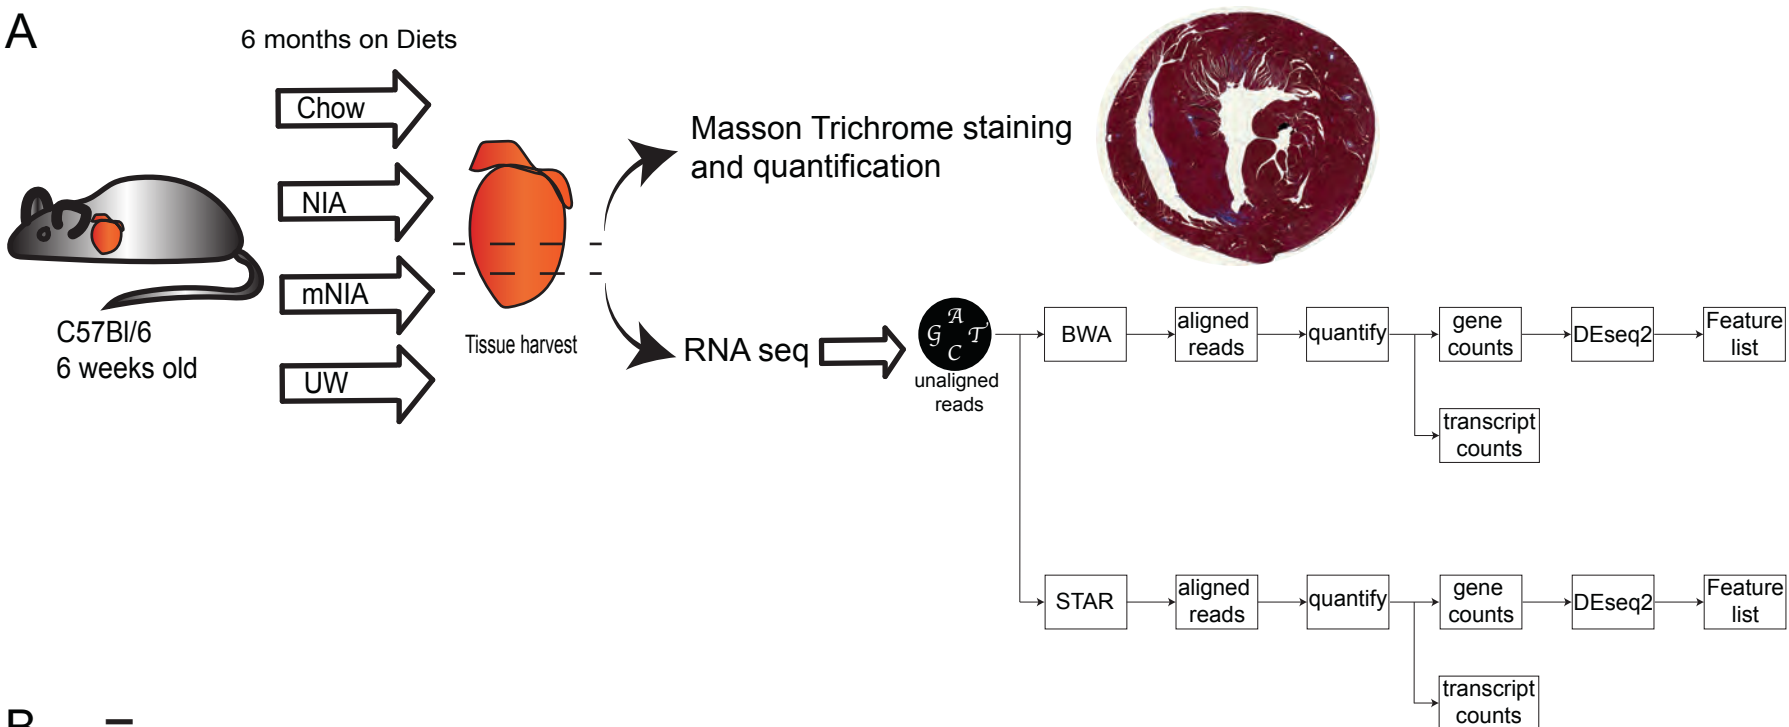

UW

Supplementary Figure 1. Representative images of whole Masson Trichrome stained left ventricle tissues from an NIA and UW NHP from the longitudinal CR study cohorts, scale bar: 1000 μ m

Figure S2

Supplementary Figure 2:

A: Experimental setup for the investigation of long-term high sucrose consumption on cardiac fibrosis in mice.

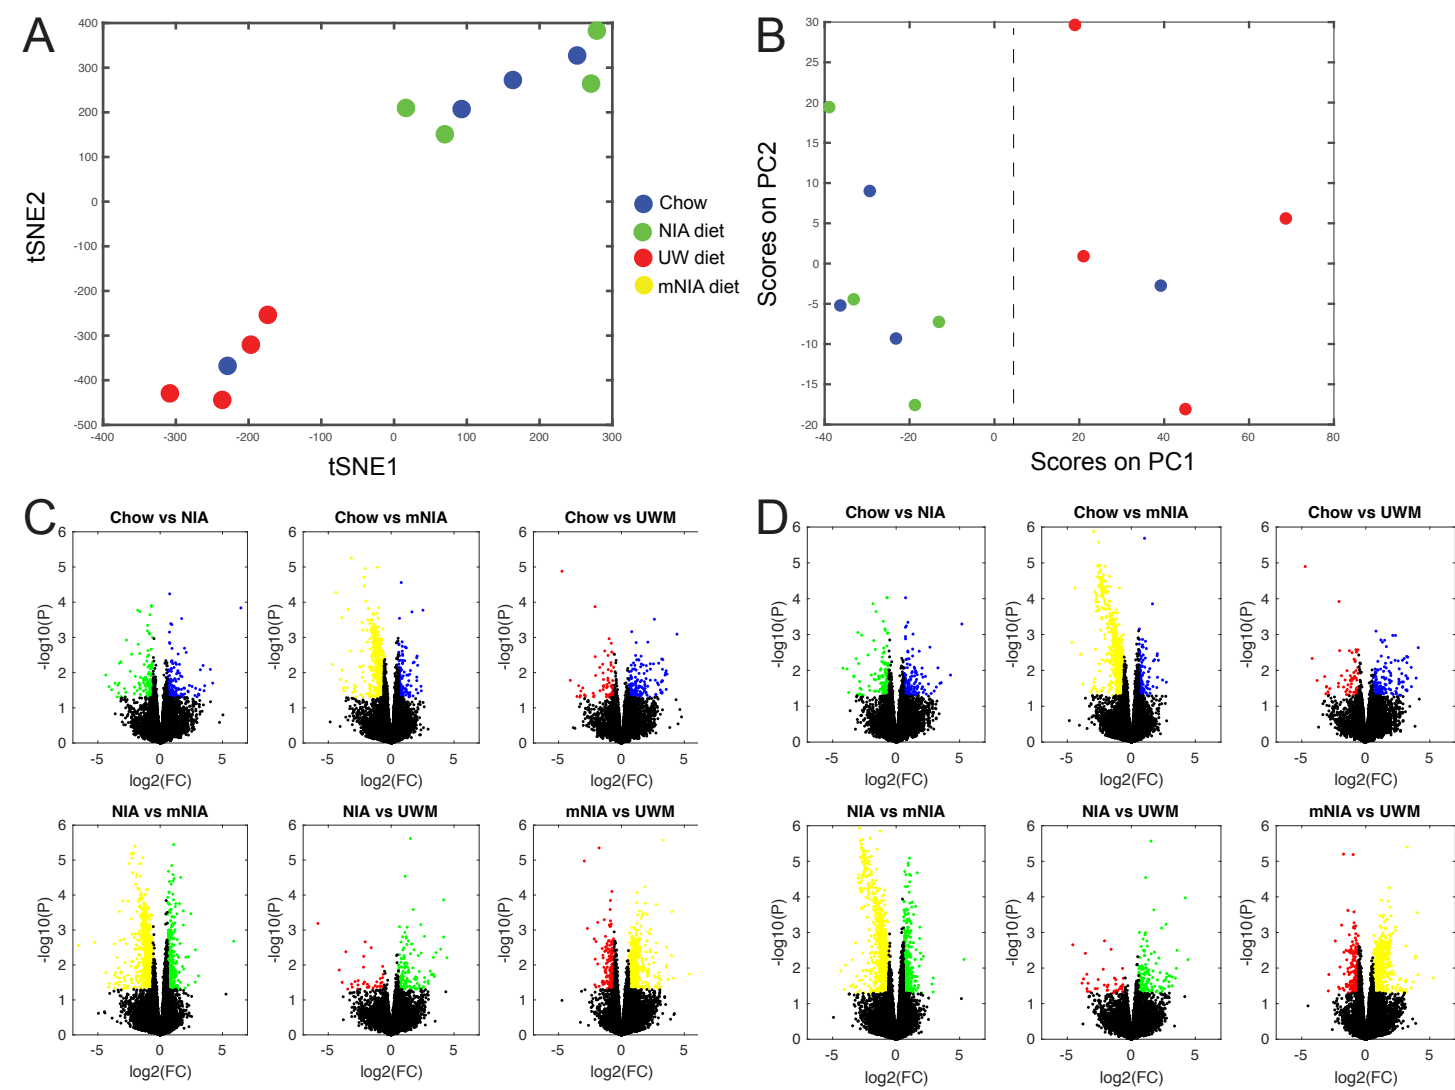

B: Five-hour fasting glucose levels after 6 months on chow, NIA, UW and mNIA diets overall $p < 0.01$ Kruskal-Wallis test. In the figure panel, pairwise significance / lack of significance is indicated based on p value from pair-wise Mann-Whitney U-tests with appropriate Bonferroni corrections to adjust for multiple comparisons, $*p < 0.05$. Scatter plots to represent the data are shown with median and interquartile range.

C: Five-hour fasting plasma insulin after 6 months on diet, overall $p < 0.05$, pairwise significance is indicated based on post-hoc Mann Whitney U-test with Bonferroni multiple testing correction, $*p < 0.05$. Scatter plots to represent the data are shown with median and interquartile range.

D: Hepatic triglyceride content after 6 months on diet, overall $p < 0.0001$, one-way ANOVA, pairwise significance is indicated based on post-hoc two-tailed t-test with Bonferroni multiple testing correction, $*p < 0.05$, $**p < 0.01$, $***p < 0.001$. Scatter plots to represent the data are shown with mean and SEM.

E: Plasma triglyceride content after 6 months on diet, overall $p = \text{non-significant}$, one-way ANOVA, pairwise $p = \text{non-significant}$ based on post-hoc two-tailed t-test with Bonferroni multiple testing correction. Scatter plots to represent the data are shown with mean and SEM.

Figure S3

Supplementary Figure 3:

A: Technical replicate of t-SNE visualization of global transcriptomic profiles of hearts from mice fed chow, NIA and UW diets

B: Three-way principal component analysis of chow, NIA and UW diets.

C: Volcano plots illustrating genes that are differentially expressed between each pair of diets using an alternate alignment algorithm – STAR.

D: Volcano plots illustrating genes (instead of transcripts as in Fig. 3C) that are differentially expressed between each pair of diets

Supplementary Table 1: Test statistics of age at death for NIA and UW NHPs analyzed in this study

Comparison	<i>p</i> value (pair-wise Mann-Whitney test with Bonferroni multiple testing correction)
NIA control vs. UW control	0.1191
NIA CR vs. UW CR	~1 (non-significant)
NIA vs. UW	0.4134

Supplementary Table 2: Enrichment of significantly differentially expressed genes across KEGG pathways

Higher in mNIA compared to chow

Pathway	Enrichment	P value	FDR	Genes involved
Cardiac muscle contraction	11.4	0.0004	0.115	Cox6b1, Cox7a1, Tpm1, Uqcrb
Alzheimer's disease	6.4	0.0001	0.15	Cox6b1, Cox7a1, Grin2a, Gsk3b, Uqcrb

Higher in mNIA compared to NIA

Pathway	Enrichment	P value	FDR	Genes involved
Oxidative phosphorylation	12.5	< 0.00001	< 0.00001	Cox6b1, Atp5g1, Atp5k, Cox17, Cox5b, Cox6a2, Cox6c, Cox7a1, Cox7a2, Cox7c, Cox8b, Ndufa2, Ndufa4, Ndufs4, Cox7a2l, Ndufb6, Atp5l, Atp5o, Ndufa1, Atp5j2, Ndufs5, Ndufb5, Ndufa3, Ndufb9, Ndufc1, Ndufa12, Ndufa7, Ndufb3, Uqcrh, Uqcr11, Atp5e, Ndufa6, Ndufb8, Uqcrb, Ndufa5, Ndufb10, Ndufa8, Ndufa11, Atp5h, Ndufv2, Ndufs7
