Supplementary Material
Germain et al. 2022

Supplementary Figure 1: Violin plots of the $\log _{2} \mathrm{FC}$ distribution for each timepoint and each cohort.

Supplementary Figure 2: Pathway analysis results from MetaboAnalyst at each timepoint for the female cohort. The pathway impact on the $y$-axis from 0 (low impact) to 1 (strong impact), represents the values from the pathway topology analysis. Each circle denotes a pathway, and the fill-in color represents the significance of disturbances in that pathway from white (low significance) to red (higher significance). The pathway numbers are as follows: \#1 "Alanine, aspartate and glutamate metabolism"; \#2 "alpha-Linolenic acid metabolism"; \#3 "Amino sugar and nucleotide sugar metabolism"; \#4 "Aminoacyl-tRNA metabolism"; \#6 "Arginine and proline metabolism"; \#12 "Caffeine metabolism"; \#13 "Citrate cycle (TCA cycle)"; \#14 "Cysteine and methionine metabolism"; \#25 "Glycerolipid metabolism"; \#26 Glycerophospholipid metabolism"; \#27 "Glycine, serine and threonine metabolism"; \#28 Glycolysis/Gluconeogenesis"; \#29 "Glyoxylate and dicarboxylate metabolism"; \#32 "Linoleic acid metabolism"; \#34 "Nicotinate and nicotinamide metabolism"; \#37 "Pentose and glucuronate interconversions"; \#38 "Pentose phosphate pathway"; \#43 "Primary bile acid biosynthesis"; \#45 "Purine metabolism"; \#47 "Pyruvate metabolism"; \#57 "Taurine and hypotaurine metabolism"; \#59 "Tryptophan metabolism"; \#60 "Tyrosine metabolism".

Supplementary Figure 3: ChemRICH output for D1POST for the female cohort. Only clusters enriched at $p<0.05$ are shown. The x -axis is the cluster order on the similarity tree. The $y$-axis is the $-\log (p$-value), with the most significantly altered clusters at the top. The color scale represents the portion of metabolites with a ratio of patients/controls either decreased (in blue), increased (in red) or an equal number of metabolites both increased and decreased (in purple).

Supplementary Figure 4: ChemRICH output for D2PRE for the female cohort. Only clusters enriched at $p<0.05$ are shown. The $x$-axis is the cluster order on the similarity tree. The $y$ axis is the $-\log (p$-value), with the most significantly altered clusters at the top. The color scale represents the portion of metabolites with a ratio of patients/controls either decreased (in blue), increased (in red) or an equal number of metabolites both increased and decreased (in purple).

Supplementary Figure 5: ChemRICH output for D2POST for the female cohort. Only clusters enriched at $p<0.05$ are shown. The $x$-axis is the cluster order on the similarity tree. The $y$-axis is the - $\log (p$-value), with the most significantly altered clusters at the top. The color scale represents the portion of metabolites with a ratio of patients/controls either decreased (in blue), increased (in red) or an equal number of metabolites both increased and decreased (in purple).

Supplementary Figure 6: ChemRICH output of $\triangle \mathrm{D} 1$, the 24-hour recovery period, and $\Delta \mathrm{D} 2$ for male controls and ME/CFS patients. Only clusters enriched at $p<0.05$ are shown. The $x-$ axis is the cluster order on the similarity tree. The $y$-axis is the $-\log (p$-value), with the most significantly altered clusters at the top. The color scale represents the portion of metabolites with a ratio of patients/controls either decreased (in blue) increased (in red) or an equal number of metabolites both increased and decreased (in purple).

Supplementary Figure 7: ChemRICH output of $\triangle \mathrm{D} 1$, the 24-hour recovery period, and $\Delta \mathrm{D} 2$ for all controls and ME/CFS patients. Only clusters enriched at $p<0.05$ are shown. The x axis is the cluster order on the similarity tree. The $y$-axis is the $-\log (p$-value), with the most significantly altered clusters at the top. The color scale represents the portion of metabolites with a ratio of patients/controls either decreased (in blue) increased (in red) or an equal number of metabolites both increased and decreased (in purple).

Supplementary Table 1. Details of the population statistics without sex segregation.
$\begin{array}{ll|c|c|}$\cline { 3 - 4 } \& \& Controls \\ $\left.\mathrm{n}=45\end{array}\right)$

* Higher scores represent better health.

NA: Not applicable.
ND: Not determined.

Supplementary Table 3. Percentages of unknown metabolites for each timepoint and each cohort.
Percentages in bold highlight an enrichment of unknowns compared to the percentages of unknowns in the dataset (20\%). The information in parenthesis is also visually depicted in Figure 3
as the bars within the histogram bars.
