Protocol: siRNA-mediated knockdown

SMARTpool siRNAs (mixture of 4 siRNA), siRNA targeting ELOVL4, and negative control siRNA were obtained from Dharmacon™-Horizon Discovery. HACaT and N/TERT cells (approximately 2×10^5) were seeded into 12-well plates. After overnight incubation, cells were transfected with 20 pmol of SMARTpool siRNAs using Lipofectamine RNAiMax Reagent (ThermoFisher Scientific) as per manufacturer's instructions.

Protocol: Culture and stimulation of primary human keratinocyte cell lines

Primary human keratinocytes isolated from healthy controls (n=50) were cultured in 12-well plates until they reached 70% confluence. Medium was 154CF, Kit (Catalog number: M154CF500) supplemented with HKGS (Catalog number: S001K) and 0.1mM calcium. Keratinocyte cultures were then stimulated in parallel for 12h with IL-17A (10ng/ml), TNF (10ng/ml), or IFN γ (5ng/ml). At time of harvest cells were barely confluent.
