Supplementary Figure 4 (separate file): PCA of each patient in the Northwestern Cohort: Each sphere represents a skin biopsy from the Northwestern Cohort, where the size of a sphere size is proportional to mRSS and color indicates its assigned intrinsic subset (black, healthy control; green, normal-like; blue, limited; red, fibroproliferative; purple, inflammatory). The green region represents the health bubble. The golden sphere indicates the centroid of healthy controls. Numbers in brackets represent the mRSS score at a given time point for a given patient. Each figure ($N = 183$ for each) displays the same set of samples with different patient trajectory highlighted.
