

1 Supplemental Data

2 **Supplemental Figure 1. Four cortical module analysis. Connection length correlates with rate of**
3 **connection degeneration over 2 years in preHD. (A) Cross sectional analysis:** Z-scores, denoting loss of
4 connection strength, were transformed into positive atrophy measures using a logistic transform. Average
5 transformed connection strength Z-score for preHD participants was plotted against connection weighted
6 path length for average control. Connections colour coded according to type. **(B) Longitudinal analysis:** Z-
7 scores, denoting connection rate of atrophy over 3 time points, were transformed into a positive rate of
8 atrophy measure using a logistic transform. Average transformed connection rate of change Z-score for
9 preHD participants were plotted against connection weighted path length for average control and Spearman
0 rank correlations performed. For both (A) and (B) each data point represents a brain connection. Intra-M –
1 intra-modular (magenta), Intra-H – intra-hemispheric (green), Inter-H – inter-hemispheric (red), CS –
2 cortico-striatal (blue). The black line represents a least squares linear regression line. ρ = correlation, p =
3 p-value, DF = degrees of freedom. Please note that data points and ρ values are same for cortical module
4 analyses 4, 6 and 8 as the module assignment does not alter the connection atrophy measures or the shortest
5 weighted path length. Differing module partitions changes the assignment of connection type, specifically
6 whether a connection is classed as intra-modular or inter/intra-hemispheric.

(A) PreHD cross-sectional change in connection type and shortest weighted path length

(B) PreHD longitudinal change in connection type and shortest weighted path length

1 **Supplemental Figure 2. Eight cortical module analysis. Connection length correlates with rate of**
2 **connection degeneration over 2 years in preHD. (A) Cross sectional analysis:** Z-scores, denoting loss of
3 connection strength, were transformed into positive atrophy measures using a logistic transform. Average
4 transformed connection strength Z-score for preHD participants was plotted against connection weighted
5 path length for average control. Connections colour coded according to type. **(B) Longitudinal analysis:** Z-
6 scores, denoting connection rate of atrophy over 3 time points, were transformed into a positive rate of
7 atrophy measure using a logistic transform. Average transformed connection rate of change Z-score for
8 preHD participants were plotted against connection weighted path length for average control and Spearman
9 rank correlations performed. For both (A) and (B) each data point represents a brain connection. Intra-M –
0 intra-modular (magenta), Intra-H –intra-hemispheric (green), Inter-H – inter-hemispheric (red), CS –
1 cortico-striatal (blue). The black line represents a least squares linear regression line. rho = correlation, p =
2 p-value, DF = degrees of freedom. Please note that data points and rho values are same for cortical module
3 analyses 4, 6 and 8 as the module assignment does not alter the connection atrophy measures or the shortest
4 weighted path length. Differing module partitions changes the assignment of connection type, specifically
5 whether a connection is classed as intra-modular or inter/intra-hemispheric.

Supplemental Figure 3. Histograms of *shortest weighted path length* for different classes of connection.
 Intra-modular (magenta), Intra-hemispheric (green), Inter-hemispheric (red), Cortico-striatal (blue). Y-axis: frequency of connection length in a given interval (intervals generated automatically by MATLAB hist function in order to cover range of values in data). X-axis: *shortest weighted path length*

Shortest weighted path length

1 **Supplemental Figure 4. Split site Leiden-Vancouver analysis. Connection length correlates with rate**
2 **of connection degeneration over 2 years in preHD. (A) Cross sectional analysis:** Z-scores, denoting loss
3 of connection strength, were transformed into positive atrophy measures using a logistic transform. Average
4 transformed connection strength Z-score for preHD participants was plotted against connection weighted
5 path length for average control. Connections colour coded according to type. **(B) Longitudinal analysis:** Z-
6 scores, denoting connection rate of atrophy over 3 time points, were transformed into a positive rate of
7 atrophy measure using a logistic transform. Average transformed connection rate of change Z-score for
8 preHD participants were plotted against connection weighted path length for average control and Spearman
9 rank correlations performed. For both (A) and (B) each data point represents a brain connection. Intra-M –
0 intra-modular (magenta), Intra-H –intra-hemispheric (green), Inter-H – inter-hemispheric (red), CS –
1 cortico-striatal (blue). The black line represents a least squares linear regression line. rho = correlation, p =
2 p-value, DF = degrees of freedom.

1 **Supplemental Figure 5. Split site London-Paris analysis. Connection length correlates with rate of**
2 **connection degeneration over 2 years in preHD. (A) Cross sectional analysis:** Z-scores, denoting loss of
3 connection strength, were transformed into positive atrophy measures using a logistic transform. Average
4 transformed connection strength Z-score for preHD participants was plotted against connection weighted
5 path length for average control. Connections colour coded according to type. **(B) Longitudinal analysis:** Z-
6 scores, denoting connection rate of atrophy over 3 time points, were transformed into a positive rate of
7 atrophy measure using a logistic transform. Average transformed connection rate of change Z-score for
8 preHD participants were plotted against connection weighted path length for average control and Spearman
9 rank correlations performed. For both (A) and (B) each data point represents a brain connection. Intra-M –
0 intra-modular (magenta), Intra-H –intra-hemispheric (green), Inter-H – inter-hemispheric (red), CS –
1 cortico-striatal (blue). The black line represents a least squares linear regression line. rho = correlation, p =
2 p-value, DF = degrees of freedom.

1 Supplemental Table 1. Cortical module assignments

	Cortical Region		Cortical Region
Module 1	L.caudalanteriorcingulate L.caudalmiddlefrontal L.lateralorbitofrontal L.medialorbitofrontal L.parsopercularis L.parsorbitalis L.parstriangularis L.rostralanteriorcingulate L.rostralmiddlefrontal L.superiorfrontal L.frontalpole L.insula	Module 2	R.caudalanteriorcingulate R.caudalmiddlefrontal R.lateralorbitofrontal R.medialorbitofrontal R.parsopercularis R.parsorbitalis R.parstriangularis R.posteriorcingulate R.rostralanteriorcingulate R.rostralmiddlefrontal R.superiorfrontal R.frontalpole
Module 3	L.bankssts L.entorhinal L.fusiform L.inferiortemporal L.middletemporal L.parahippocampal L.superiortemporal L.temporalpole L.transversetemporal L.hippocampus	Module 4	R.hippocampus R.bankssts R.entorhinal R.fusiform R.inferiortemporal R.middletemporal R.parahippocampal R.superiortemporal R.temporalpole R.transversetemporal R.insula
Module 5	L.cuneus L.inferiorparietal L.isthmuscingulate L.lateraloccipital L.lingual L.paracentral L.pericalcarine L.postcentral L.posteriorcingulate L.precentral L.precuneus L.superiorparietal L.supramarginal	Module 6	R.cuneus R.inferiorparietal R.isthmuscingulate R.lateraloccipital R.lingual R.paracentral R.pericalcarine R.postcentral R.precentral R.precuneus R.superiorparietal R.supramarginal

1 **Supplemental Table 2. Cross-sectional mixed linear model results: Cortico-striatal (VCP) and intra-**
2 **modular connections.** γ – estimated group intercept difference (preHD minus control; see Equation 1), SE
3 – standard error of the difference, p-value – probability value, q-value – FDR corrected p-value. Cross-
4 sectional group difference at first visit was defined as the intercept main effect of group in the full linear
5 mixed effects model.

Cortico-striatal connection (VCP)	γ	SE	p-value	q-value
Left striatum fronto-cingulate	-0.159	0.020	1.2×10^{-14}	7.23×10^{-14}
