Supplementary Figure 1. mRNA levels of GLUT1 in subcutaneous adipose tissue from non-OSA, OSA therapeutic c-PAP and OSA sub-therapeutic c-PAP obese subjects at baseline and after 24 weeks of c-PAP treatment. Subcutaneous adipose tissue biopsies were obtained from non-OSA (white bars), OSA therapeutic c-PAP (black bars) and OSA sub-therapeutic c-PAP (grey bars) obese subjects at baseline (panel A) and after 24 weeks of treatment (panel B). Total RNA was extracted, and mRNA levels of GLUT1 were determined by qRT-PCR and normalized to 18S rRNA. Results are mean \pm SE of values in adipose tissue ($n=2$ measurements for each subject; 4 non-OSA, 6 OSA therapeutic c-PAP and 10 OSA sub-therapeutic c-PAP). Differences between groups were assessed with one-way ANOVA statistical analysis.

Supplementary Figure 2. Relationship between ESS and adipose tissue inflammation at baseline and after c-PAP treatment. *Top panels:* correlation between ESS and mRNA levels of CD36, CD68 and ERO1 in OSA obese subjects at baseline ($n=16$ OSA therapeutic c-PAP subjects and $n=15$ OSA sub-therapeutic c-PAP subjects). *Bottom panels:* correlation between ESS and mRNA levels of CD36, CD68 and ERO1 in OSA obese subjects after c-PAP treatment ($n=16$ OSA therapeutic c-PAP subjects and $n=15$ OSA sub-therapeutic c-PAP subjects). Statistical analysis was performed using Pearson correlation.
