

Supplemental Material

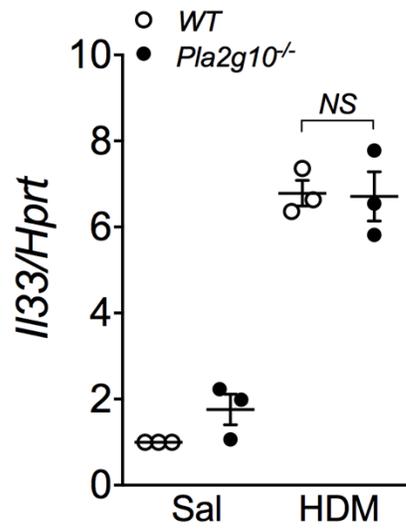

Supplemental Figure 1: Cellular localization of sPLA₂-X staining in the lung and confirmation of *Pla2g10* genetic ablation. Staining of WT lung tissue with an anti-sPLA₂-X antibody showing positive staining in (A) the airway epithelium (scale bar, 50 μm) and (B) alveolar macrophages (black arrowhead) and monocyte derived (recruited) macrophages (white arrowhead; scale bar, 20 μm). Insets show detailed staining of epithelium and macrophages. Quantitative assay of sPLA₂-X protein in (C) stomach ($n = 4$ mice/group) and (D) testes ($n = 8$ for *Pla2g10*^{-/-} and 12 for WT) from WT and *Pla2g10*^{-/-} mice confirming that global genetic ablation results in the lack of sPLA₂-X protein. Mean ± SEM, unpaired *t*-test.

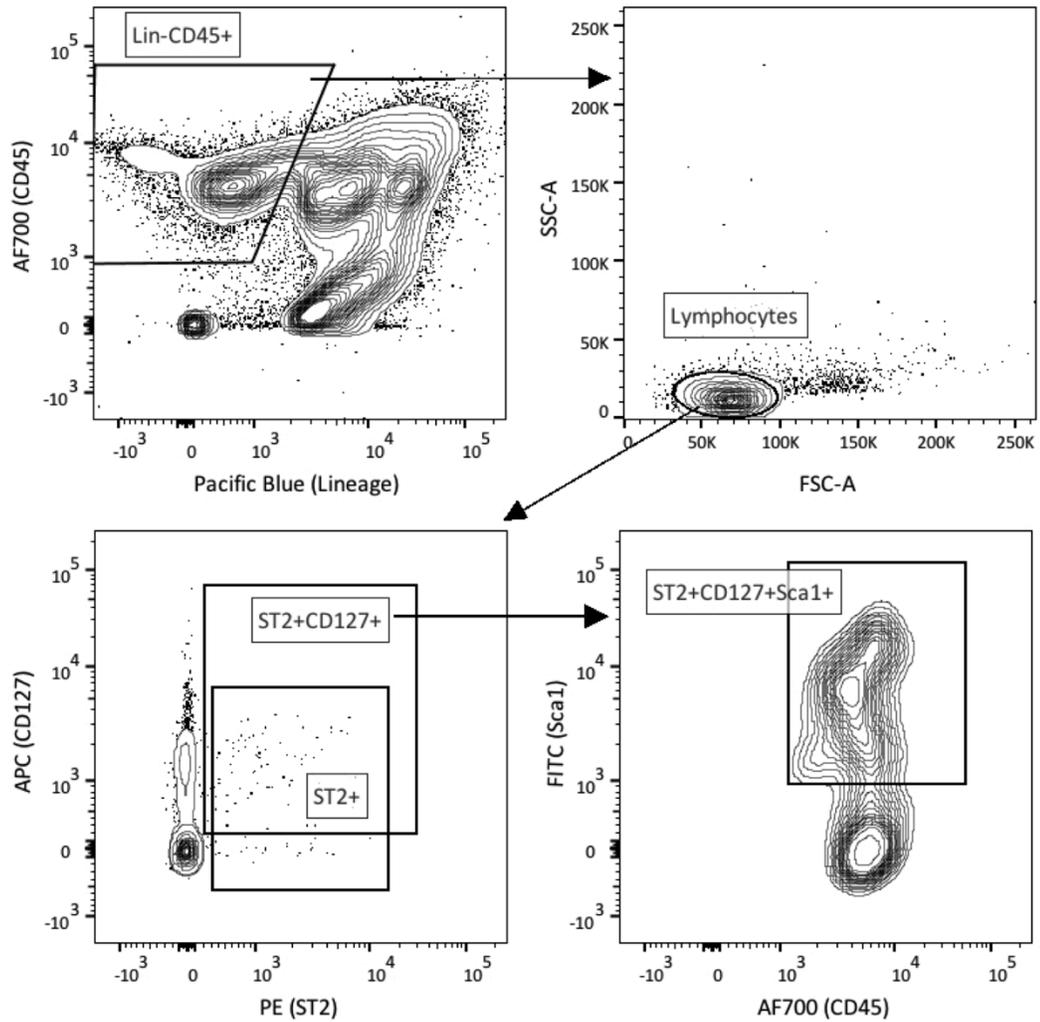

Supplemental Figure 2: Neutrophil concentrations in the BAL and lung. No differences in neutrophil influx were observed between *WT* and *Pla2g10^{-/-}* mice in **(A)** BAL fluid or **(B)** lung tissue following sensitization and challenge with HDM ($n = 3$ mice/group for Sal, 7 mice for *WT* HDM and 8 mice for *Pla2g10^{-/-}* HDM).

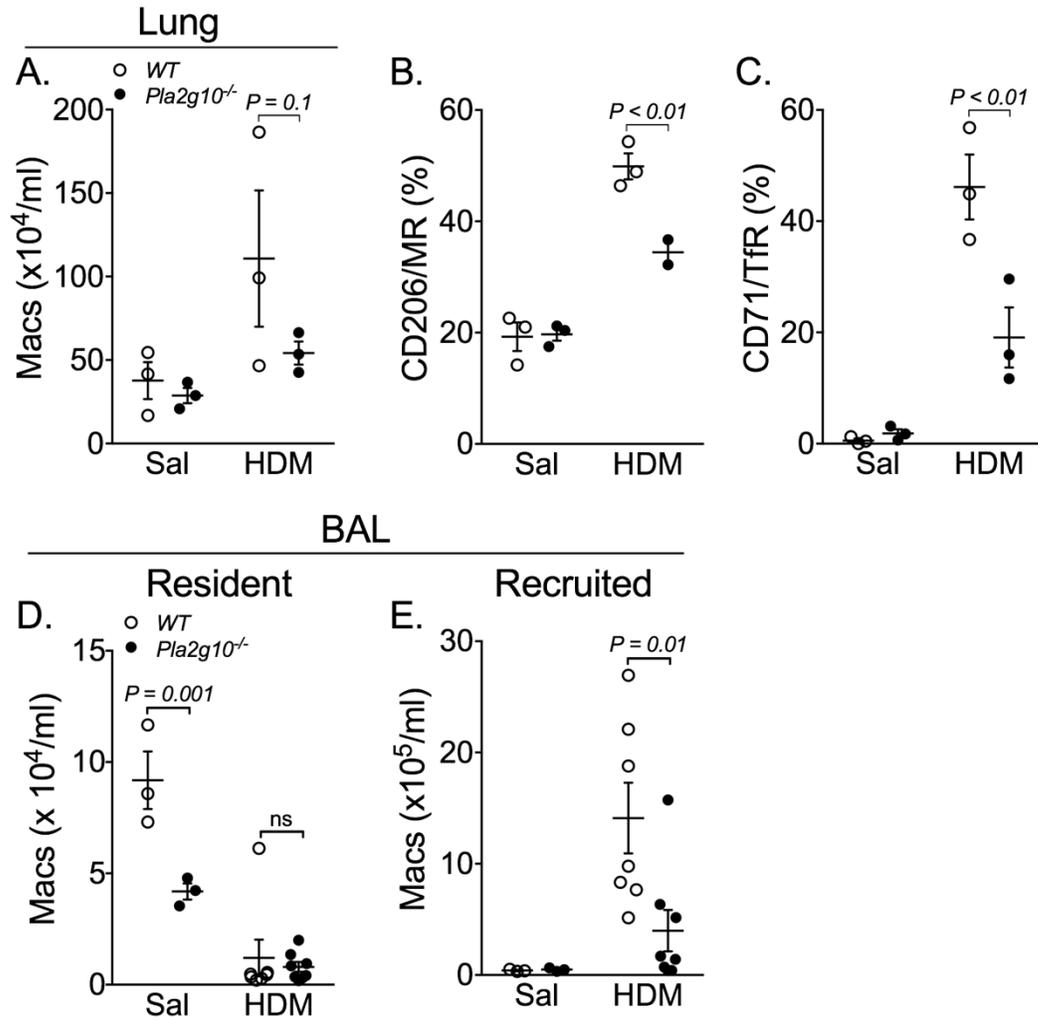

Supplemental Figure 3: Lack of *Pla2g10* alters PGD₂ production. Concentration of PGD₂ in BAL fluid from HDM-sensitized and challenged WT and *Pla2g10*^{-/-} mice ($n = 5$ mice/group). Mean \pm SEM, 2-way ANOVA with uncorrected Fisher's LSD.

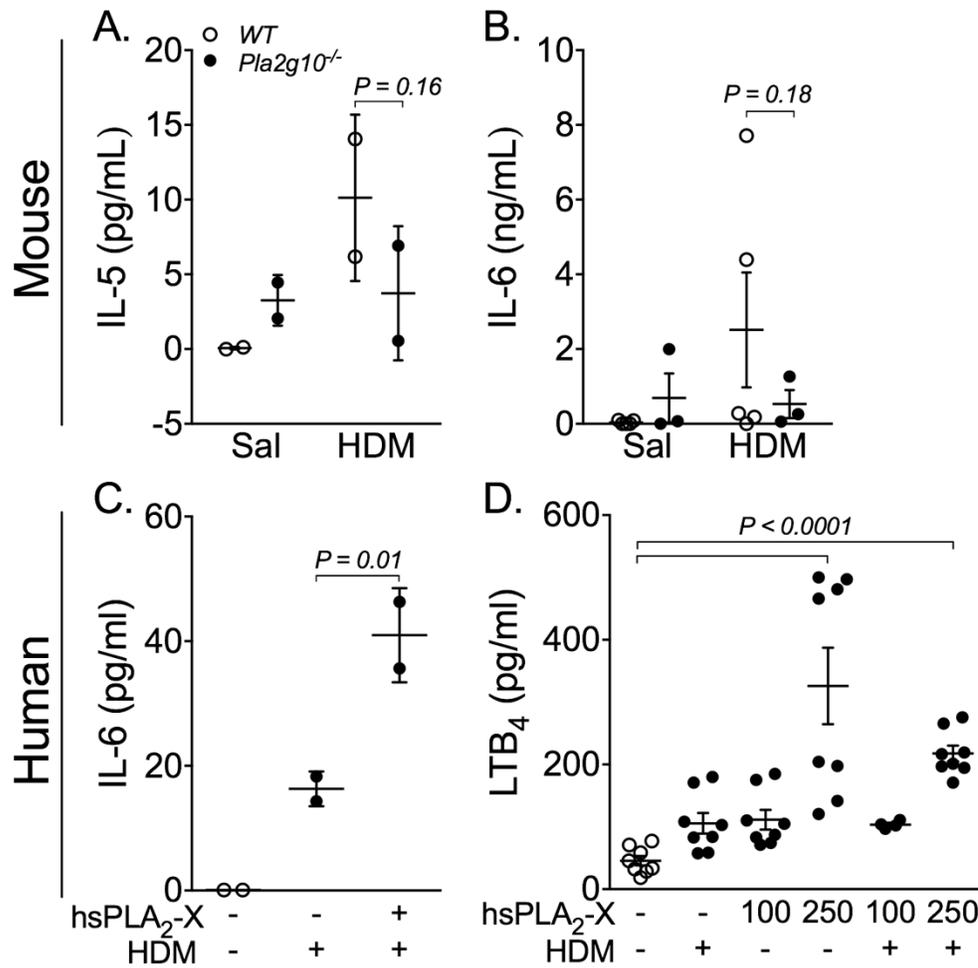

Supplemental Figure 4: Lack of *Pla2g10* does not affect IL-33 gene expression. Expression of *Il33* in lung tissue from HDM-sensitized and challenged WT and *Pla2g10*^{-/-} mice ($n = 3$ mice/group). Mean \pm SEM, 2-way ANOVA with uncorrected Fisher's LSD.

Supplemental Figure 5: Gating strategy for characterization of lung ILC2s. Lineage negative CD45 expressing ($\text{Lin}^- \text{CD45}^+$) cells were isolated and further gated by side and forward scatter area for lymphocytes. From the lymphocyte gate, Lin^- cells were further characterized as ST2^+ , $\text{ST2}^+ \text{CD127}^+$, or $\text{ST2}^+ \text{CD127}^+ \text{Sca1}^+$.

Supplemental Figure 6: Resident and recruited macrophage populations in lung tissue and BAL fluid following HDM exposure. **(A)** Concentration of macrophages in the lungs of WT and *Pla2g10^{-/-}* mice ($n = 3$ mice/group). Mean \pm SEM. **(B)** Percentages of CD206/MR⁺ macrophages and **(C)** CD71/TfR⁺ macrophages in the lungs of WT and *Pla2g10^{-/-}* mice ($n = 3$ mice/group). Mean \pm SEM. **(D)** Assessment of resident macrophages in the BAL fluid of WT and *Pla2g10^{-/-}* mice ($n = 3$ mice/group for Sal, 7 mice for WT HDM and 8 mice for *Pla2g10^{-/-}* HDM). Mean \pm SEM. **(E)** Assessment of recruited macrophages in the BAL fluid of WT and *Pla2g10^{-/-}* mice ($n = 3$ mice/group for Sal, 7 mice for WT HDM and 8 mice for *Pla2g10^{-/-}* HDM). Mean \pm SEM. Statistical significance was determined using 2-way ANOVA with uncorrected Fisher's LSD.

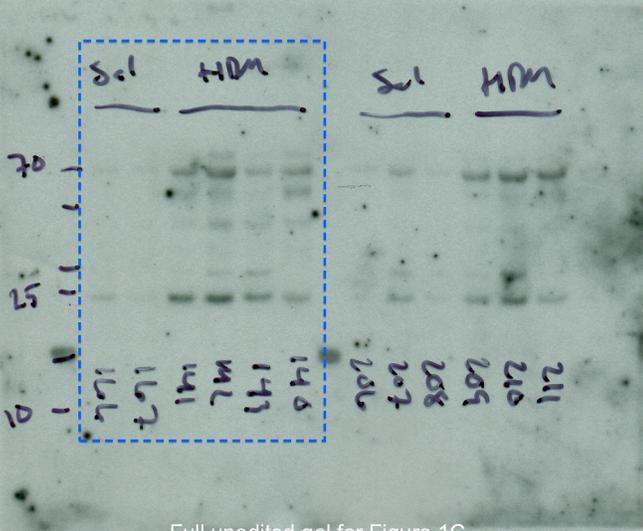

Supplemental Figure 7: Effects of sPLA₂-X on the activation of murine and human macrophages. **(A)** IL-5 and **(B)** IL-6 cytokine concentrations isolated from the lungs of *WT* and *Pla2g10^{-/-}* murine macrophages following treatment with either saline or HDM (For IL-5: $n = 2$ /group, mean \pm SD; for IL-6: $n = 5$ /group for *WT* and 3/group for *Pla2g10^{-/-}*, mean \pm SEM). Human peripheral blood macrophages release **(C)** IL-6 and **(D)** LTB₄ in response to stimulation with HDM or recombinant human sPLA₂-X (hsPLA₂-X), though the effects on LTB₄ are not additive (For IL-6: $n = 2$ /group, mean \pm SD; for LTB₄, $n = 4$ -8/group, mean \pm SEM). Statistical analyses for panels **A** and **B**, 2-way ANOVA with uncorrected Fisher's LSD; for panel **C**, one-way ANOVA; for panel **D**, Kruskal-Wallis test.
